

1. `readyState` tells the current stage of the `XMLHttpRequest`, while `status` tells the HTTP response status from the server. For example, `readyState 4` means the request is complete, while `status 200` means the request was successful.

2. The request can be made asynchronous by setting the third parameter of `xhr.open()` to `true`. For example: `xhr.open("GET", "https://jsonplaceholder.typicode.com/posts/1", true)`.

3. Asynchronous communication is recommended because it allows the web page to continue working while waiting for the server response. This makes the application faster, smoother, and more responsive for users.
